SUMMARY

Hands-on technical leader with 8+ years designing, securing, and operating cloud infrastructure at scale. Scaled from engineer to Principal SRE at Red Hat, architecting AWS IAM security and Go automation for large managed-OpenShift fleets, and now designing and building a SaaS platform end-to-end as co-founder and CTO.

SKILLS

Go, Kubernetes, OpenShift, Operators, AWS, Azure, GCP, IAM, Python, Terraform, CI/CD, Git, Linux, Prometheus

EXPERIENCE

CTO & Co-founder December 2025 - Present
Axon Data
- As the primary engineer, took the product from zero to a six-figure-revenue platform serving paying customers, architecting and building the full stack from scratch: REST API, Go/Python microservices, databases, and infrastructure as code.
- Engineered a multi-tenant Go/Python platform with Temporal-orchestrated workflows that automatically detects, enriches, and remediates data-quality issues end to end, replacing manual multi-step coordination.
- Designed and implemented the SOC 2 control environment to Type II attestation, establishing the security posture required to close multiple deals with security-conscious customers.
- Set technical direction for a two-person engineering team, mentoring the other engineer, while personally building and architecting the majority of the product across the stack.

Principal Site Reliability Engineer July 2018 - December 2025
Red Hat, Managed OpenShift & ROSA
Promoted: Associate SRE → SRE → Senior SRE → Principal SRE
- Expanded from leading 7 SREs to shaping engineering strategy across a global 50+ engineer organization (ROSA & OpenShift Dedicated), partnering with product management on technical direction and prioritization beyond any single team.
- Helped build Red Hat's managed OpenShift v4 offering from pre-launch through growth to hundreds of customers and thousands of clusters, partnering with customers and business-unit stakeholders on technical direction.
- Architected and owned the AWS IAM managed policy underpinning ROSA HCP, a foundational component of the product's security model; partnered directly with AWS to approve and ship least-privilege hardening changes, and served as lead technical owner for proposals across Red Hat teams.
- Built mission-critical Kubernetes operators in Go for the managed-OpenShift service, such as cloud account provisioning and customer-facing networking capabilities specific to the offering.
- Operated 100s of OpenShift clusters on 24/7 on-call against a 99.95% uptime SLA, protecting mission-critical workloads for major enterprises including a top US airline, resolving critical outages and leading post-mortems that drove permanent fixes.
- Led ARM node support for ROSA HCP end to end, from design and feasibility to implementation, across teams; shipped ahead of schedule to meet a Fortune 500 customer's cost-reduction timeline.

Infrastructure Intern, CoreOS June 2017 - September 2017
Student System Administrator, Open Source Lab January 2015 - June 2017

EDUCATION

Bachelor of Science, Computer Science (focus: Mathematics & Music)
Bachelor of Science, Music (focus: Vocal Performance)
Oregon State University

AWS Certified SysOps Associate - April 2021
CKA: Certified Kubernetes Administrator - November 2021
